Connected-EV Driver & Fleet Engagement Platform — Telematics, Battery Life, CO₂ & Rewards

Product Proposal — for Internal Approval

EV-only · BEV · PHEV · HEV | 2026-06-15 | Confidential — Internal

Visual identity shown is an INTERIM Yinson-green system, pending alignment to the official drivEV brand guideline.

The opportunity

drivEV puts drivers and fleets into EVs through flexible leasing and fleet electrification; chargEV runs the charging network. What is missing is the daily engagement layer that compounds the value of both — turning every kilometre into retention, utilisation and charging demand.

This proposal requests approval to build the **drivEV engagement platform**: a connected-EV app for **retail lease drivers and fleet operators** that converts real driving into a daily habit through four reinforcing loops — **telematics & eco-coaching**, **battery-life protection**, **CO₂ & cost savings**, and **Eco-Credits rewards** redeemable across the Yinson GreenTech ecosystem (notably **chargEV**).

A working prototype is already built and demoable end-to-end — desktop and mobile, EV-only across BEV/PHEV/HEV — so the remaining work is integration and hardening, not discovery.

The ask

Fund a 2-quarter production pilot: real telematics ingestion, accounts, managed datastore, and a live chargEV reward integration, with a 500–1,000 driver + 2–3 fleet pilot.

Why it matters to the P&L

Higher lease renewal & LTV, better fleet uptime/utilisation, and increased chargEV session volume — three business lines, one engagement layer.

2 · Where this fits — the Yinson GreenTech ecosystem

drivEV does not sit alone. The engagement platform is the connective tissue across the green-mobility stack, compounding value for each business it touches.

drivEV Leasing

retail drivers

drivEV Fleet

operators

drivEV App

engagement layer

chargEV

charging network

Yinson GreenTech

ESG & brand

Retail lease drivers

Eco-coaching, savings and rewards increase satisfaction and renewal; battery-care protects residual value on returned vehicles.

Fleet operators

Fleet-level eco-scores, battery health and uptime; driver leaderboards and challenges cut energy cost and wear across the fleet.

chargEV

Charging rewards and in-app session nudges drive utilisation of the charging network — turning loyalty points into real charging demand.

Yinson GreenTech ESG

Verified, aggregated CO₂ avoided becomes a credible sustainability and brand asset across the group.

The problem

Engagement decays

Owner/charging apps are opened to find a plug, then forgotten — the lease/fleet relationship fades and upsell is lost.

Value is invisible

Drivers can't see what electric actually saves them, or how habits affect battery life and the vehicle's residual value.

Loyalty is generic

Points rarely tie to real behaviour or real perks, so they don't change habits or pull demand into chargEV.

Hybrids are mistreated

PHEV/HEV drivers get BEV- or ICE-shaped tools, with no fair, powertrain-aware view of impact.

The drivEV solution — four reinforcing loops

Telematics & eco-coaching

Every trip graded A+→E with one high-impact tip; the Simulator Lab shows in real time how speed, aggression and regen change energy, cost and credits.

Battery-life protection

State of Health, warranty tracking, life projection and tailored charging advice — protecting range and resale/residual value. Powertrain-aware.

CO₂ & cost savings

Each electrified km translated into CO₂ avoided, fuel litres and money saved vs a comparable petrol car — the tangible daily payoff.

Eco-Credits rewards

Tiers, streaks, challenges and badges redeemable for real perks — anchored by chargEV charging credit and service, plus lifestyle partners.

drivEV is deliberately **EV-only**; pure-ICE vehicles are out of scope. The platform models all three electrified powertrains as first-class citizens with a fair, powertrain-aware impact engine.

Powertrain	Electric share (modelled)	Charging	Tailored treatment
BEV — Battery Electric	100% electric	Plug-in (chargEV AC/DC)	Full battery diagnostics, charge-habit coaching, maximum savings.
PHEV — Plug-in Hybrid	~62% electric	Plug-in (chargEV AC/DC)	Blended electric+petrol impact; EV-range & charge coaching.
HEV — Hybrid	~30% electric	Self-charging (no plug)	Self-charging messaging; efficiency & regen focus.

In scope (pilot)

Driver app (web + mobile-responsive PWA), telematics ingestion, eco-scoring, battery model, CO₂/cost engine, Eco-Credits & tiers, challenges, leaderboard, chargEV reward integration, accounts, basic fleet view.

Out of scope (pilot)

Native iOS/Android wrappers, full partner marketplace, payments/billing, deep fleet TMS, insurance underwriting — designed-for, scheduled later.

Realistic, DrivEv-aligned system. **Line icons only — no emoji**, one typeface, soft surfaces, confident encouraging voice. **Palette below is INTERIM (Yinson-green) pending the official drivEV brand guideline; tokens are centralised for a one-change swap.**

Iconography
Custom inline SVG set — 24×24, 1.8px stroke,currentColor. Zero emoji.

Logo
drivEV wordmark (“EV” in accent) on the brand gradient mark, “by Yinson GreenTech” kicker.

Accessibility
Target ≥ 4.5:1 contrast and ≥ 44px touch targets; responsive from desktop to small phones.

Low-fidelity layout for the primary screen; numbered callouts map to the components below.

- ① CO₂ avoided (+ trees-equiv.)
- ③ Battery SoH + years-to-floor
- ⑤ Cumulative CO₂ saved chart
- ⑦ Recent trips with eco-grade

- ② Eco-Credits + tier multiplier
- ④ Driver / powertrain persona switch
- ⑥ Loyalty tier, streak & badges
- ⑧ Battery care + powertrain badge

Dashboard — live, personalised per driver and powertrain.

Simulator Lab — sliders recompute energy, money, battery stress and Eco-Credits in real time.

Product Proposal — Internal Approval

Confidential

Mobile wireframe

Onboarding · Dashboard · Simulator Lab — fixed bottom tab bar, stacked cards, touch-first.

Built as clean, swappable services so the pilot ships fast and scales without rework. The prototype already separates the domain engine from storage and presentation.

Ingestion (provider-agnostic)

Normalised trip/telemetry contract behind a thin adapter — Smartcar / OEM APIs / OBD with no change to the domain engine. Webhook + poll.

Domain engine

Pure, testable modules: eco-scoring, battery SoH, CO₂/cost, loyalty economy. Powertrain-aware; tuned via a single config.

chargEV & partners

Reward fulfilment + session signals integrate with chargEV; partner perks behind a rewards service with codes/ledger.

Data, API & clients

Stateless REST; pilot moves file store → managed Postgres with per-driver isolation. Responsive web/PWA now; native later; no runtime CDN dependency.

Scalability path

Stateless services + managed datastore + pre-computed aggregates (leaderboards, impact) scale to fleet-wide volumes with cheap reads.

Phase	Window	Outcome
0 · Prototype DONE	Complete	End-to-end demo: four loops, EV powertrains, brand system, desktop + mobile.
1 · Production Pilot	Q3-Q4 2026	Telematics ingestion, accounts, Postgres, chargEV reward, 500-1,000 drivers + 2-3 fleets.
2 · Scale & Marketplace	Q1-Q2 2027	Native apps, partner marketplace, fleet console v1, A/B engagement, regional CO ₂ factors.
3 · Platform	H2 2027	Full fleet/B2B TMS hooks, insurance & lease integrations, open partner API.

Phase-1 team (indicative)

2 full-stack, 1 mobile/front-end, 0.5 designer, 0.5 data, 0.25 PM, plus chargEV/partner & legal support. ~2 quarters.

KPIs — tied to the business (pilot targets)

Lease renewal / LTV

Measurable uplift in renewal intent & retention vs control.

Fleet utilisation/uptime

Higher utilisation; lower energy cost & harsh-event rate per fleet.

chargEV sessions

Reward-driven increase in charging sessions per active driver.

D30 retention

+15-25 pts vs a charging-only baseline app.

Eco-score lift

Cohort average improves over 8 weeks.

Residual protection

Battery-care score uplift on leased vehicles.

Key risks & mitigations

Risk	Mitigation
Telematics coverage / OEM API limits	Provider-agnostic adapter; widely-supported APIs first; OBD fallback.
Data privacy & consent (location)	Explicit consent, data minimisation, regional (MY/SG) compliance in Phase 1.
Reward economics	Tunable points economy; anchor on chargEV; cap liabilities.
Model accuracy (battery/CO ₂)	Transparent heuristics now; calibrate vs real telemetry & regional grid factors.

Decision requested

Approve drivEV to proceed to a Phase-1 production pilot (retail + fleet) with the indicated team and ~2-quarter timeline, and authorise the chargEV reward integration.

Immediately on approval

1. Align to the official drivEV brand guideline; swap interim tokens/logo.
2. Confirm telematics provider(s) and sign data agreements (MY/SG).
3. Stand up accounts + managed Postgres; wire the ingestion adapter.
4. Integrate chargEV charging credit end-to-end.
5. Recruit 500-1,000 drivers + 2-3 fleets across BEV/PHEV/HEV; run an 8-12 week measured pilot.

Already de-risked

Product, UX and the full engagement loop are built and demoable today — Phase 1 is integration and hardening.

Appendices

Live prototype, brand notes (BRAND.md), wireframe pack and screenshot deck accompany this proposal.
