BOARD REVIEW · CAPITAL & UNIT ECONOMICS

The Next 1,000

A capital-efficient path from **~400 to ~1,433 units** — built on four engines, not one B2C campaign.

drivEV · October 2026 · Figures read live from the cohort model · Illustrative

1,433	+1,033	RM24.2m	RM242m
ENDING BOOK · M36	NET NEW UNITS	PEAK EQUITY	PEAK ASSETS FINANCED

The next 1,000 is a portfolio, not a funnel.

The growth plan headlines “1,000 B2C drivers.” The economics say: win the 1,000 **net-new units** across four channels where distribution already exists — and let the B2B base fund the B2C S-curve.

~75% **comes through relationships we already own** — B2B land-and-expand plus the salary-sacrifice bridge. Only ~25% is cold-acquired B2C.

↓ CAC These channels **aren’t CAC-constrained.** Acquisition is a sales touch inside a payroll or fleet account, not paid media.

RM They’re **capital- and residual-value-constrained.** So this deck is about the balance sheet, not the funnel.

Four engines, ranked by capital efficiency

Net-new unit contribution over the 36-month arc. CAC and LTV:CAC are illustrative model outputs.

400 units

B2B land-&-expand

Add seats inside proven fleets (Pos Malaysia anchor). Corporate credit; near-zero acquisition cost.

CAC	RM350
LTV:CAC	49×

CASH ENGINE

300 units

Salary sacrifice

Employer payroll-deduction lease — the B2B→B2C bridge. Bulk, trusted distribution; credit largely neutralised.

CAC	RM250
LTV:CAC	46×

THE BRIDGE

150 units

chargEV cross-sell

Owned, intent-rich audience across the 366→3,000 charger footprint. In-app offer to charging users.

CAC	RM600
LTV:CAC	29×

OWNED FUNNEL

150 units

Direct B2C

Cold retail via savings-calculator + GoCar. Where real paid CAC, churn and credit risk actually live.

CAC	RM1,500
LTV:CAC	6.3×

WATCH-ITEM

The bridge: B2B distribution → B2C habit → owned subscription

The salary-sacrifice + B2B2C motion is why ~75% of the 1,000 is capital-efficient: we acquire consumers through employers we already sell fleets to.

OWN

Fleet client

Existing B2B relationship (GLC / logistics / corporate) with an ESG mandate.

→

SEED

App to every driver

Every fleet & employee driver gets the drivEV app — telematics, savings, rewards.

→

OFFER

Salary-sacrifice lease

"Drive it at work, lease it for home" via payroll deduction — bulk, low-CAC, low-default.

→

RETAIN

Owned B2C subscriber

Renewals + chargEV utilisation + referrals compound the flywheel.

! **VALIDATE BEFORE RELYING · MALAYSIA**

The salary-sacrifice **tax** benefit is UK-Octopus logic (UK BiK EV exemption). Malaysia's BIK / perquisite treatment differs and has **no direct equivalent** — treat the driver tax saving as an assumption for MY counsel to confirm. The payroll-deduction **convenience & credit** benefit holds regardless.

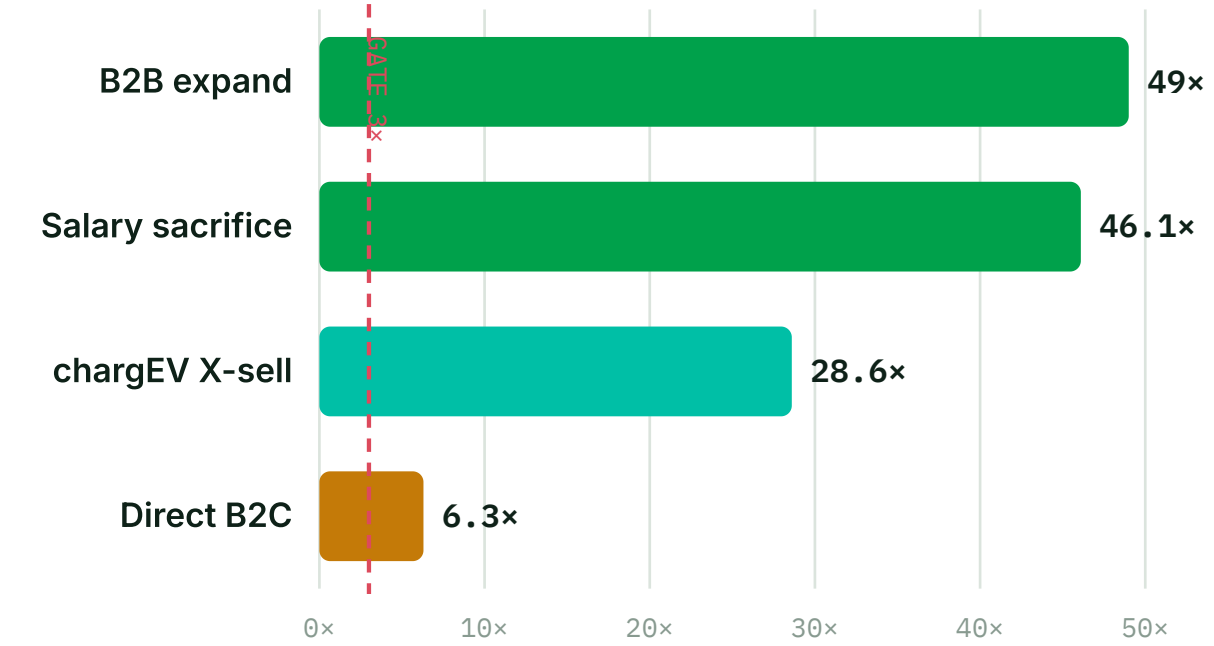

Not CAC-constrained — with one honest exception

Contribution-to-CAC over lease life (undiscounted, illustrative). The gate is 3×.

Why B2B and salary-sacrifice clear the gate by **~15×** because acquisition happens **inside existing payroll and fleet relationships** — the cost is a sales touch, not paid media.

B2C Direct B2C sits at **6.3×** — still above gate, but this is where real CAC, churn and credit risk live. It's **sequenced last and gated.**

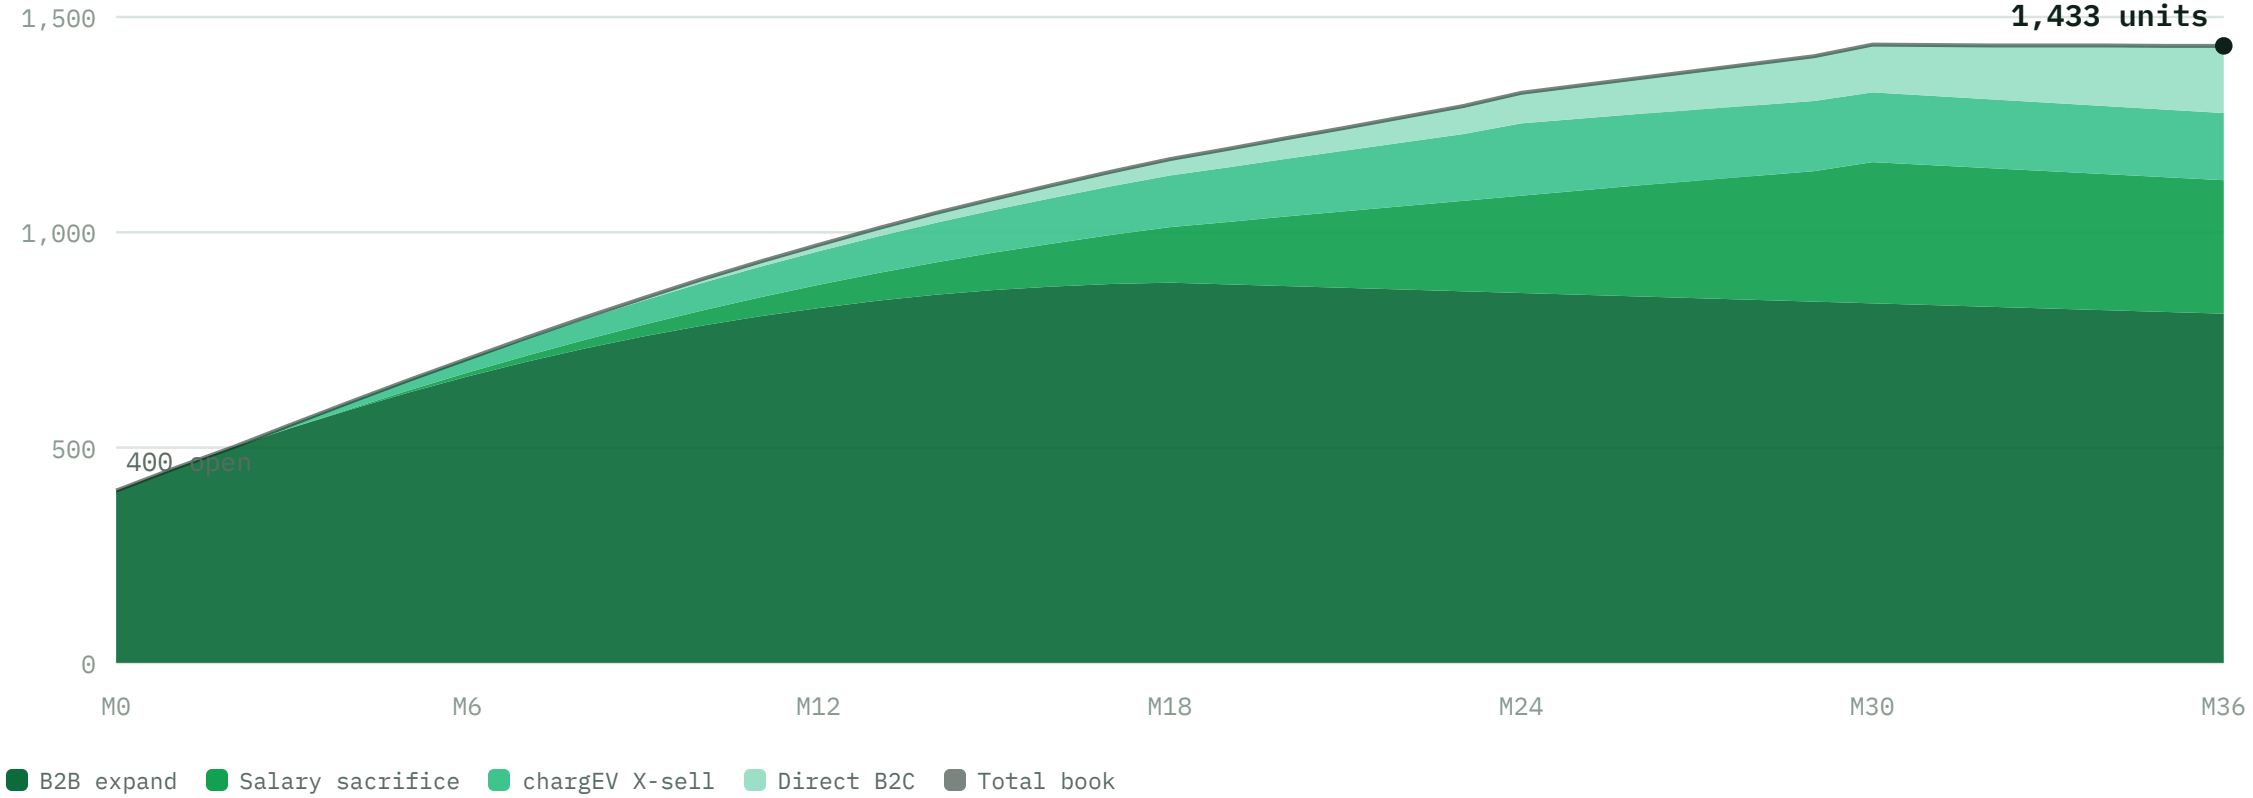

So The binding constraint isn't the funnel. It's **capital and residual value** — next two slides.

Dashed line = 3× LTV:CAC investment gate

~400 → ~1,433 units, phased and self-funding

Net book by channel. Swaps are modelled as terminations, so churn can't hide as "continuation."

RM21.4m
Cumulative net contribution after CAC, 36 mo

RM0.69m
Total CAC spend across all four channels

P1 · P2 · P3
Next-1,000 pilot → scale engine → multi-market (SG)

Confidential — internal

RM24m of equity controls RM242m of assets

Vehicles sit in an SPV funded by senior sukuk (leaning on Yinson's balance sheet) + mezzanine + a thin equity layer — off the operating company.

Senior sukuk · 70% @ 4.5% Mezzanine · 20% @ 9.0% Equity · 10%

RM242m
Peak asset base financed (M36)

RM24.2m
Peak equity at risk — the real capital ask

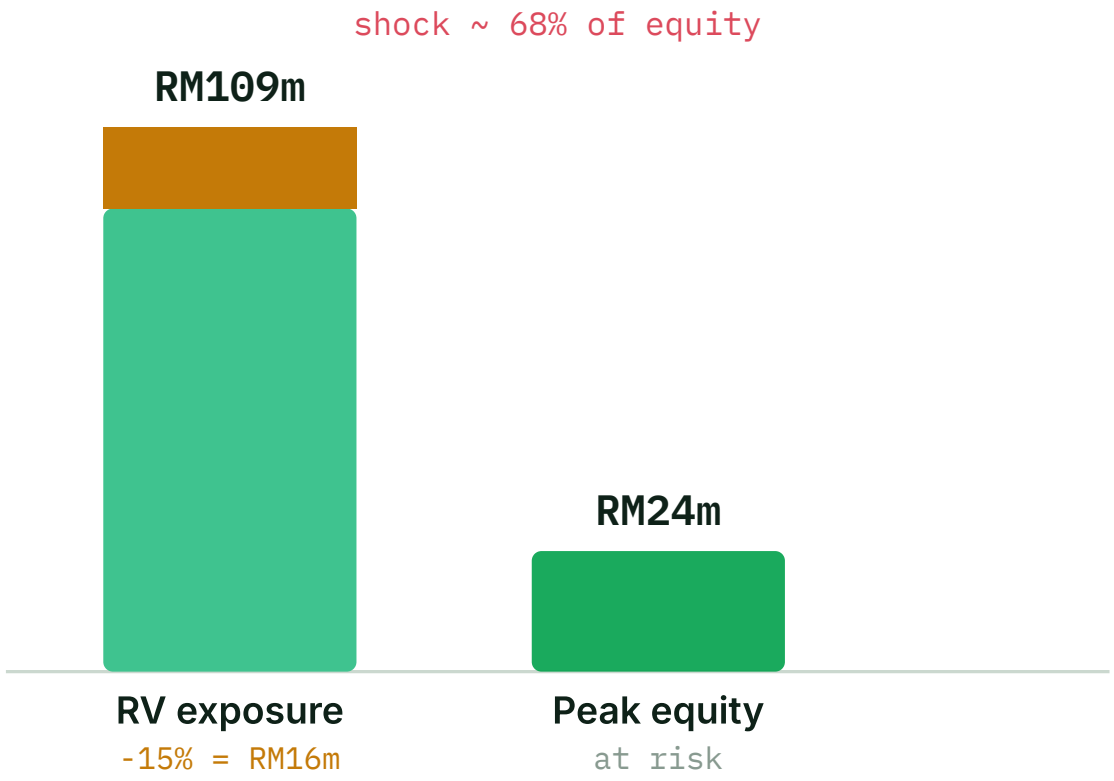

~10×
Asset leverage on equity via the SPV

Confidential — internal

Residual value, not churn, is the swing factor.

At M36 the book carries **~RM109m** of expected residual value. A **−15%** used-EV price shock erases **~RM16.4m** — about **two-thirds of peak equity.** This is the number that decides the equity return.

→ **MITIGATIONS (NOT IN THE CASHFLOWS)**
Push **RV guarantees / buyback** onto OEMs & distributors at order time · favour **shorter tenor** on price-volatile models · diversify make/model to avoid single-platform RV risk.

What has to be true before we scale spend

RISK	GATE / MITIGATION
Residual-value shock on used EVs	OEM buyback / RV guarantee at order; shorter tenor on volatile models; platform diversification
Salary-sacrifice tax treatment (MY)	Malaysian counsel sign-off on BIK / perquisite before leaning on the channel; lead with the credit benefit
B2C CAC / churn unproven	Lead low-CAC channels first; hard **LTV:CAC ≥ 3** and **payback ≤ 6 mo** gate before paid scale
PDPA at consumer scale	Granular consent, DPO, DPIA, 72-hour breach runbook before B2C scaling
Eco-Credits = regulated e-money	Keep closed-loop, earned-not-purchased (limited-purpose exemption); no cash-out
B2C financing licensing	Align lease/financing to Consumer Credit Act 2025 / CCC + HP Amendment (EIR disclosure)
Insurance reward (UBI)	Score-and-refer via a licensed insurer only; legal sign-off under FSA 2013

Full detail in the companion COMPLIANCE-RESEARCH.md. Obtain Malaysian counsel sign-off before launch.

Fund the P1 “next 1,000” — with hard gates before scale.

1. Stand up the **growth pod** + the app’s acquisition/activation loop (referrals, savings calculator, chargEV bundle).
2. Light up the **B2B2C / salary-sacrifice bridge** and the **GoCar + chargEV** conversion channels.
3. Fund the **P0 compliance enablers** (DPO, legal for financing & insurance) and the **SPV structuring**.

INVESTMENT GATES BEFORE P2

≥ 3×
LTV : CAC, blended

≤ 6 mo
CAC payback

≥ 80%
90-day retention

> 0
Gross margin after charging credit

✓ **SUCCESS LOOKS LIKE**
1,000 retained units at gate, with measurable chargEV & renewal lift — a proven, repeatable engine to take to **10,000+ and Singapore**.

The inputs behind every number

DRIVER	B2B EXPAND	SALARY SACRIFICE	CHARGEV X-SELL	DIRECT B2C
Net-new unit target	400	300	150	150
CAC (RM)	350	250	600	1,500
Monthly churn	0.5%	1.0%	0.8%	2.5%
Revenue / unit / mo (RM)	2,600	2,400	2,600	2,900
Contribution margin	22%	20%	22%	18%
Avg asset value (RM)	170,000	150,000	170,000	200,000
36-mo residual value	45%	48%	45%	42%
Avg tenor (months)	30	24	30	18

▤ **LIVE WORKBOOK**
Capital structure: senior sukuk 70% @ 4.5% · mezzanine 20% @ 9.0% · equity 10% · RV downside −15%. All figures are **illustrative planning assumptions**, not committed numbers — change any input in **drivEV-Next-1000-Cohort-Model.xlsx** and the book, economics and capital recalculate.
