

drivEV Growth Plan — Deepen B2B, Launch B2C, Win the Next 1,000

By: Yinson GreenTech · drivEV · **Date:** 2026-06-16 · **Status:** Internal strategy **Scope interpretation:** drivEV is B2B-led (fleet electrification, e.g. Pos Malaysia) and is now scaling B2C (retail lease/subscription + GoCar car-sharing). This plan keeps B2B as the cash-generative base and builds a repeatable B2C engine, with a concrete **"next 1,000 B2C drivers"** beachhead milestone on the path to 10,000+.

1 · Ambition & North-Star

Mission: make every electrified kilometre in Malaysia (then SG) cheaper, cleaner and more rewarding — so drivers and fleets stay, charge on chargEV, and refer others.

North-Star Metric (NSM): Monthly Active, Retained Drivers (MARD) — drivers (B2C subscribers + active fleet seats) who logged ≥ 8 trips and opened the app in the last 30 days. It links the three businesses: NSM $\uparrow \rightarrow$ lease renewal $\uparrow$, chargEV sessions $\uparrow$, ESG impact $\uparrow$.

12-18 month targets (illustrative):

Horizon	B2C drivers	Active fleet seats	NSM (MARD)	chargEV sessions/active driver/mo
Now	seed (GoCar/pilot)	existing fleets	baseline	baseline
+2 quarters — "next 1,000"	1,000 B2C	+2-3 new fleets	70% of base	+20%
+4 quarters	4,000 B2C	6-8 fleets	65%+	+35%
+6 quarters	10,000 B2C + SG pilot	12+ fleets	60%+	+50%

2 · Where we play (segments)

B2B (deepen — the base):

- **Last-mile / logistics fleets** (proven: Pos Malaysia 143+136 e-vans) — highest TCO pain, fastest payback.
- **Corporate & GLC fleets** (ESG mandates, NETR alignment) — sales/pool cars, executive fleets.
- **Ride-hail / taxi & shuttle operators** — high mileage = high EV savings.
- **Government & municipal** — policy tailwind.

B2C (scale — the new S-curve):

- **Urban professionals** in Klang Valley & Johor Bahru wanting an EV without 3-year lock-in or big upfront — drivEV's flexible-lease promise.
- **GoCar car-sharers** (existing Dec-2024 partnership in JB) — a warm, EV-curious funnel to convert to subscription.
- **B2B2C: fleet & corporate drivers** — give the drivEV app to fleet/employee drivers first; convert the best to personal B2C subscriptions ("drive it at work, lease it for home").

Geography: Malaysia first (Klang Valley + JB beachhead), Singapore as fast-follow (chargEV/CDG-ENGIE network + GoCar already cross-border).

3 · The growth flywheel (why the app is the engine)

The app turns a commodity lease into a **daily, rewarding relationship**: it lowers churn (renewal), pulls demand into **chargEV** (a second revenue line), creates a **referral loop** (lower CAC), and produces **driving data** that unlocks **usage-based insurance discounts** (lower TCO → more conversions). Each loop compounds the others.

4 · Deepen B2B (the cash engine)

1. **Land-and-expand** within existing fleets: start with one depot/route, prove TCO + uptime via the app's fleet dashboard, then expand seats. Target **net seat retention >120%**.
2. **Fleet-Electrification-as-a-Service** bundle: vehicles + chargEV infrastructure + financing + driver app + carbon reporting (assurance-ready for clients' own ESG filings) — sold as one outcome, not parts.
3. **New verticals**: logistics → ride-hail → corporate → government, reusing the same playbook & case studies (Pos Malaysia as the anchor reference).
4. **B2B as a B2C funnel (B2B2C)**: every fleet driver gets the app → seeds B2C habit, referrals, and warm leads for personal subscriptions.

5 · The "next 1,000" B2C playbook (the concrete milestone)

Beachhead: Klang Valley + Johor Bahru urban professionals + the existing **GoCar EV** user base. Win 1,000 paying B2C subscribers in ~2 quarters, then templatised.

Acquisition channels (ranked by expected CAC efficiency):

Channel	Motion	Why it's efficient
GoCar conversion	Convert EV car-sharers → flexible subscription (in-app offer, trial credit)	Warm, EV-validated audience already in-funnel
Referrals (in-app)	Eco-Credits for referrer + referee; leaderboard kudos	Product-led, near-zero CAC; targets K-factor ≥ 0.4
B2B2C / employer benefit	"EV salary-sacrifice / staff lease" via existing fleet clients	Distribution through trusted employers; bulk
chargEV cross-sell	Promote drivEV to chargEV app users (366→3,000 charger footprint)	Owned audience, intent-rich
Digital performance	Savings-calculator landing page → lead → test drive	Measurable; calculator is strong TOFU
Dealer/OEM & showroom	Co-marketing with EV models drivEV leases (GAC, GWM, Maxus)	Buyer at decision point

Funnel & targets (illustrative): Awareness → **Savings Calculator** (the hook) → Lead → Test drive / GoCar trial → **Subscribe** → Activate (≥8 trips/mo) → Retain → Refer.

- Visitor→lead 6-8%, lead→subscriber 12-15%, activation ≥70%, 90-day retention ≥80%.
- **CAC target ≤ RM800 blended** (referrals/B2B2C pull it down); **LTV:CAC ≥ 3:1**; **CAC payback ≤ 6 months** on subscription margin + chargEV.

Activation & retention (product-led):

- Onboarding "connect & see your savings" in <60s; first-week challenge; streaks; weekly eco-score nudge; chargEV-credit reward at day 7 and day 30.
- Win-back + renewal offers surfaced in-app 60 days before lease end.

6 · Pricing & packaging

- **Flexible tiers:** short-commit subscription (premium price, max flexibility) → 12-month (best value) → fleet seat (volume). No mileage cap; transparent EIR financing (Consumer Credit Act-compliant).
- **Bundle chargEV:** included home-charging survey + monthly charging credit on higher tiers → ties the two businesses and improves stickiness.
- **UBI insurance discount** (score-and-refer via a licensed insurer) as a tier perk → lowers effective TCO, a conversion lever.
- **Referral economics** funded from CAC savings (give Eco-Credits, not cash) — keeps the rewards in the closed-loop e-money exemption.

7 · Partnerships (distribution leverage)

Partner	Role	Growth value
chargEV (in-house)	Charging + rewards redemption	TCO bundle, owned audience, second revenue line
GoCar	Car-share → subscription funnel	Warm B2C acquisition
OEMs/dealers (GAC, GWM, Maxus)	Vehicle supply + co-marketing	Lower COGS, showroom leads
Employers / GLCs	EV staff-benefit / fleet	Bulk B2B2C distribution
Licensed insurer	UBI discount product	TCO lever (keep drivEV to score+refer)
Banks / CCC-licensed credit	Financing	Approval rates, compliant B2C credit

8 · Metrics & unit economics

Growth dashboard: NSM (MARD); new subscribers & fleet seats; CAC by channel; LTV:CAC; CAC payback; activation %; 30/90-day retention; renewal rate; **referral K-factor**; chargEV sessions/active driver; net seat retention (B2B); verified CO₂ avoided. **Guardrails:** LTV:CAC ≥ 3, payback ≤ 6 mo, 90-day retention ≥ 80%, gross margin per subscription positive after charging credit.

9 · Phased roadmap

Phase	Window	Goal	Key moves
P1 — Next 1,000	2 quarters	1,000 B2C in KV+JB	GoCar conversion, referrals, savings-calculator, app activation loop, chargEV bundle
P2 — Scale engine	+2 quarters	4,000 B2C; B2B2C live	Employer benefit channel, OEM co-marketing, UBI discount, paid scale on proven CAC
P3 — Multi-market	+2 quarters	10,000 B2C + SG pilot	Singapore launch (PDPC-compliant), marketplace of rewards, fleet console v1

10 · Org & capabilities to add

Growth lead (PLG + lifecycle), performance-marketing + content, partnerships manager (GoCar/employers/OEM), data analyst (funnel + unit economics), B2C ops/onboarding, plus the **compliance roles the research flagged** (DPO, legal for FSA/insurance & Consumer Credit Act). Small, cross-functional "growth pod" owning the funnel end-to-end.

11 · Risks & mitigations (incl. compliance)

Risk	Mitigation
B2C CAC too high / unproven	Lead with low-CAC channels (GoCar, referrals, B2B2C) before paid; hard LTV:CAC ≥ 3 gate
Charging anxiety blocks B2C	Bundle chargEV credit + home survey; in-app charger map/roaming
PDPA at consumer scale	Granular consent, DPO, DPIA, 72h breach runbook (see compliance research) before scaling
Eco-Credits = regulated e-money	Keep closed-loop, earned-not-purchased (limited-purpose exemption); no cash-out
B2C financing licensing	Align lease/financing to Consumer Credit Act 2025 / CCC + HP Amendment (EIR)
Insurance-reward licensing	Score-and-refer via licensed insurer; legal sign-off (FSA 2013)
Greenwashing on savings claims	Substantiate CO ₂ (ISO 14064-1/GHG Protocol); assurance-ready for NSRF
EV incentive changes (road-tax exemption ended 2025)	Compete on flexibility + TCO + rewards, not just incentives

12 · The ask

Approve and fund the **P1 "next 1,000" B2C pilot** (2 quarters): a growth pod, the app's acquisition/activation loop (referrals, savings calculator, chargEV bundle), the GoCar conversion channel, and the P0 compliance enablers — with hard unit-economics gates before scaling spend in P2. Success = **1,000 retained B2C drivers at LTV:CAC ≥ 3 , with measurable chargEV and renewal lift** — a proven, repeatable engine to take to 10,000+ and into Singapore.

Targets are illustrative planning assumptions to be calibrated against pilot data. Compliance items reference the companion COMPLIANCE-RESEARCH.md; obtain Malaysian counsel sign-off before launch.
