FOR CY · AHEAD OF THE BOARD

Starting the B2C Platform

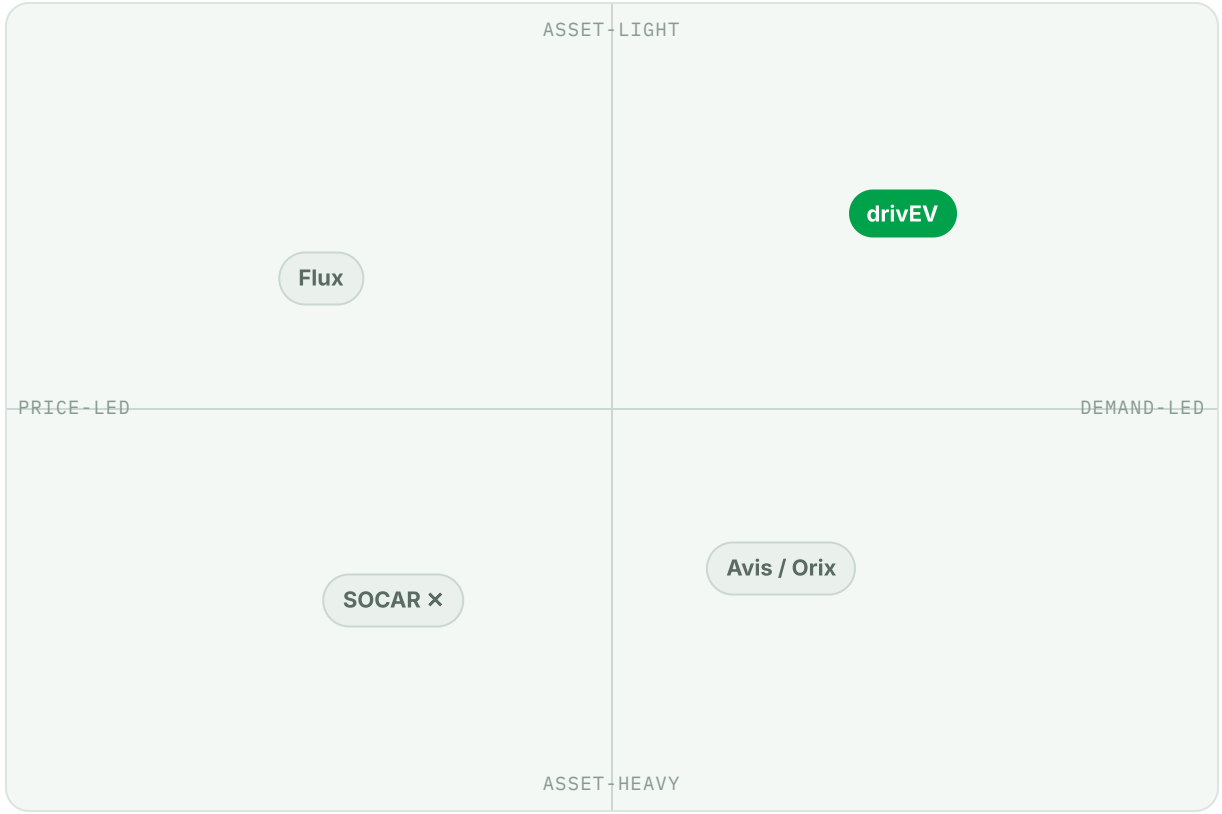

Flux 2.0 — an asset-light launch. **Own the customer, not the car.**

drivEV · October 2026 · Illustrative figures — real inputs flagged inside

RM2–4m	~313 units	M19–26	asset-light
ONE-OFF INVESTMENT	MONTHLY BREAK-EVEN	PATH TO PAYBACK*	HOSTS FUND THE VEHICLES

B2C is the next S-curve — but the obvious entry is how SOCAR died.

B2B leads are thinning. Flux owns B2C on price with no retention. A cold, asset-heavy, discount-funded land-grab burns cash and strands vehicles when demand dips. We take the opposite route: **asset-light and demand-led.**

Two revenue streams — everything else is auxiliary margin

B2B — the cash engine

Proven leasing base (Pos, corporates, GLCs). Funds the business and bridges into B2C.

B2C — the growth engine

Asset-light platform (Flux 2.0). The new S-curve we are asking to fund.

AUXILIARY MARGIN STACK · chargEV · insurance / NCD · Smart-EV digital · second-life remarketing

Charging, digital and loyalty are **margin stackers that make each unit worth more** — not separate businesses to pitch. Don't sell Smart-EV standalone (~RM60/vehicle, easily copied); use it to make leasing sticky.

A growing market, one-dimensional incumbents, a moat no financier has

NETR targets ~15% xEV of sales by 2030 (38% by 2040). Only drivEV pairs leasing with an owned charging network and a B2B base to bridge from.

PLAYER	MODEL	ASSET	RETENTION	CHARGING	B2B BASE
drivEV (Flux 2.0)	**Op-lease + platform**	**Light (host-funded)**	**Loyalty + telematics**	**chargEV (owned)**	**Yes — the bridge**
Flux	Subscription	Own balance sheet	None — price only	Third-party	Limited
SOCAR × (closed)	Car-sharing	Heavy	App only	Third-party	No
Avis / Orix	Financial lease	Capital-heavy	Contractual	Third-party	Corporate

Data required: TAM/SAM for MY B2C EV lease; Flux fleet size & price points; confirm SOCAR closure reason.

Own the customer, not the car

Partners fund the vehicle and carry the asset + RV risk. drivEV collects payment, keeps a platform fee, and owns the customer — scaling 1,000 units without parking RM150–300m on YGT's balance sheet.

DEMAND

Subscriber

B2C / corporate driver pays a monthly subscription to drivEV.

→

PLATFORM

drivEV keeps a fee

Collects payment, retains platform fee, owns the customer + data + brand.

→

SUPPLY

Host funds the car

5–6 partners × 30–50 units. Host bears vehicle, road-tax, insurance, maintenance, **RV risk**.

! **THE MAKE-OR-BREAK PROOF**

The whole case rests on **partner-funded price beating Flux** for the same model. If it does, it's a no-brainer. **This is the first number Christine must bring.**

The legal spine: operational lease, the right entities & licences

We are an operational-lease business (not financial). A clean multi-entity structure and the right licences are prerequisites, not afterthoughts.

ESTATE

Owns / holds vehicles

Or host-owned under asset-light.

COMMERCIAL

Used-car dealership licence

Enables second-life resale.

SERVICES

Insurance

Hire-and-drive cover.

DIGITALEV

Marketplace (tech co)

Platform sits here, as Flux does.

→ OPEN ITEMS TO CLOSE

Hire-and-drive vs **tourism-licence** dependency (Amanda) · CI stamping **pending** (Jun Sing) · multi-entity accounts rationale (Sumi) · align to **Consumer Credit Act 2025 / CCC** + PDPA (see COMPLIANCE-RESEARCH.md).

Every showroom becomes our sales channel.

We don't scale on a small internal team — we turn dealers, employers and ESG mandates into demand, and we make noise.

OEM Dealer showrooms (Wuling live; Stellantis, Cycle&Carriage) offer leasing as the alternative to a cash sale.

Corp Employee-benefit / expat-hire catalogue; ESG-mandate & high-diesel-cost segments.

Noise PR launch + signing ceremonies with named partners; savings-calculator + referral.

▤ **WORK THE FUNNEL BACKWARDS**

400 new units ÷ ~30% conversion ⇒ the monthly lead target, split across reps.

Data required: real lead volumes & conversion by channel; media/PR budget.

! Kelvin's ask #2: not just the *segments*, but **how we shop to the market** — media, press, showroom reach.

We will fight a price war — the question is who funds the discount

The first two months need acquisition firepower against Flux. Before we launch, the Board must decide the funding and cap the burn.

The decision

Does **drivEV** or the **host partner** fund the introductory discount? This single choice changes our cash exposure.

The discipline

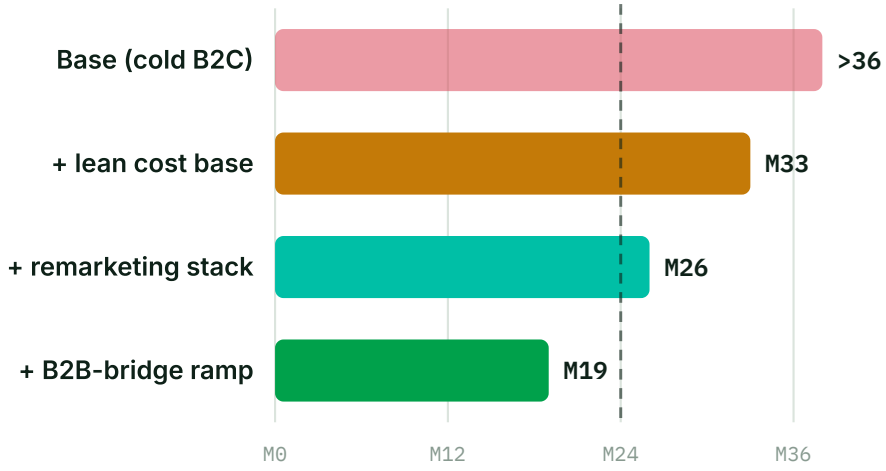

Size the war chest to a defined CAC and share-of-voice target, with a **hard stop**. We don't win on price alone — chargEV + the B2B bridge lower effective CAC.

$ THE QUESTION KELVIN WILL ASK

"What is your war chest for this war project?" — **answer it with a number and a cap.** Inputs required: war-chest size, price-war CAC, discount-funding split.

On platform fee alone it doesn't pay back — here's what makes it

Monthly break-even ≈ **313 active units**. As modelled, cold-B2C base case pays back beyond 36 months. Three management-controllable levers bring it inside the target.

Dashed line = 24-month payback target

Lean Cut fixed cost base (RM120k→70k/mo): **M33**.

Stack Add second-life remarketing + charging + insurance margin: **M26**.

Bridge Ramp through the B2B/salary-sacrifice bridge, not cold CAC: **M19** — beats target.

i Scenarios (end-M24 units): Worst 200 · Conservative 400 · Base 650 · Upside 1,000. Y2 contribution turns positive from Base up.

The 143 + 136 returning Pos e-vans are supply, not a problem.

Under the Commercial entity's used-car licence, we remarket the returning fleet into the B2C platform as **lower-cost, de-risked supply** — improving unit economics and giving the platform inventory to launch with.

RETURN

143 + 136 e-vans come back

Over the Pos lease term.

CONVERT

Title & registration

Resolve conversion from client name early.

REMARKET

Into B2C as second-life supply

Cheaper inventory → better unit economics.

Confidential — internal

The three risks that decide this — named and gated

RISK	WHY IT BITES	MITIGATION / GATE
Residual value	China used-EV price war compresses RV	Asset-light pushes RV to hosts; OEM buyback / RV guarantee at order
Demand–supply	No demand ⇒ host partners walk	Gate ramp to committed demand; keep run-rate lean
War-chest / price war	Unfunded discount burns cash	Hard cap; co-fund with partners; don't win on price alone
Compliance	PDPA, e-money, financing, insurance	Closed-loop Eco-Credits; CCA 2025; FSA score-and-refer (see research)

Residual value is the swing factor on equity return — the same lesson as the Next-1,000 unit model.

Approve a gated POC — build, launch, 5–6 partners.

1. Fund **~RM2–4m**: platform build, PR launch, war chest, first host-partner cohort.
2. Brief **CY → Louisa → Board** with worst/base/upside numbers and a clear recommendation.
3. Replace placeholders with the **real inputs** before CY (partner price vs Flux, war chest, opex, lead volumes).

GO / NO-GO GATES BEFORE SCALE

< Flux
Partner-funded price beats Flux

≤ 24 mo
Payback on the three levers

demand-first
Committed demand before supply

capped
War chest with a hard stop

✓ **THE RECOMMENDATION**
Yes — but asset-light, lean, demand-led, and ramped through the B2B bridge. Not a cold price war.
